

Name of the indicator	6.2 Percentage of population connected to water supply system
Sustainable Development Goal	Goal 6. Clean water and sanitation
Target	-
Definition	Share of the number of persons living in residential buildings and collective accommodation facilities connected to the water supply system in total population.
Unit	percent [%]
Available dimensions	total
Methodological explanations	The starting point for data estimation is the results of the National Census of Population and Housing. The data are then corrected by adding information on change of the number of completed buildings and the number of dwellings per one building (based on reports on residential buildings and dwellings in non-residential buildings completed and reports on losses of dwelling stock). The indicator of the number of persons per one dwelling comes from the balance of dwelling stocks. This is the number of actually residing population, as of December 31 in a given year, divided by the number of dwellings. Information on the newly connected or disconnected buildings is derived from the report on water supply system, sewage system and liquid waste stored in septic tanks.
Source of data	Statistics Poland
Data availability	Annual data; since 2010
Notes	-
