

Statistics for the SDGs - indicators for national priorities

Goal 2. Zero hunger Goal 2. Zero hunger Respect for biodiversity through its increase or at least non-deterioration of its sate Priority Respect for biodiversity through its increase or at least non-deterioration of its sate The indicator covers the number of plant genetic resources for food and farming (secured in gene bank collections, stored in a generative form — in a seed form and vegetative form — in the form of field plantations, in vitro cultures, microbulbes, etc.) and the number of livestock genetic resources ex situ in vitro and ex situ in vivo. Init pieces The collections of plants maintained in the gene bank include: agricultural crops (cereals, root crops, special, herbage plants, fodder crops, energy and reclamation crops, small leguminous plants, marginal legumes), vegetable and orchard plants (including root stocks of seed trees, root stocks of stone trees, berry plants), honey and decorative plants. The plant genetic resources are calculated on the basis of the database containing the number of objects and associated data. Information is available at: http://ejiset.inar-edu.pi/nioex-aspx?lang-en-Gb of liHAR-PlB. The database includes resources stored in the gene bank collections, in various forms, located at IHAR Radzikow (central seed storage) and in a number of other institutions, luciding the Institute of Horticulture in Skierniewice, the Arboretum and the Department of Physiography in Bolestrasyce Polish Academy of Sciences Botanical Garden — Center for Biological Diversity Conservation in Powsin Warsaw University of Life Sciences - SGGW Poznan University of Life Sciences Society of Friends of the Lower Vistula River in Gruczno Plant Breeding of Poznań LLC in Tulce Institute of Natural Fibres and Medicinal Plants in Poznań Institute of Soil Science and Plant Cultivation - NRI in Pulawy. The number of Ilvestock genetic resources beyond their natural habitat, including: in situ - the protection of living animals in their natural environment, existu in vivo antipolation of panetic		
Priority Respect for biodiversity through its increase or at least non-deterioration of its sate Priority Respect for biodiversity through its increase or at least non-deterioration of its sate The indicator covers the number of plant genetic resources for food and farming (secured in gene bank collections, stored in a generative form — in a seed form and vegetative form — in the form of field plantations, in vitro cultures, microbulbes, etc.) and the number of livestock genetic resources ex situ in vitro and ex situ in vivo. Init Poeces The collections of plants maintained in the gene bank include: agricultural crops (cereals, root crops, special, herbage plants, fodder crops, energy and reclamation crops, small leguminous plants, marginal legumes), vegetable and orchard plants (including root stocks of seed trees, root stocks of stone trees, berry plants), honey and decorative plants. The plant genetic resources are calculated on the basis of the database containing the number of objects and associated data. Information is available at http://egiset.lhar.edu.pl/index.aspx/lang=en-GB of IHAR-PIB. The database includes resources stored in the gene bank collections, in various forms, located at IHAR Radzików (central seed storage) and in a number of other institution, including the Institute of Horticulture in Skierniewice, the Arboretum and the Department of Physiography in Bolestrasyzee Polish Academy of Sciences Botanical Garden — Center for Biological Diversity Conservation in Powsin Warsaw University of Life Sciences Sciences Sciency of Friends of the Lower Vistula River in Gruczno Plant Breeding of Poznań LLC in Tulce Institute of Natural Fibres and Medicinal Plants in Poznań Institute of Soil Science and Plant Cultivation - NRI in Pulawy. The number of livestock genetic resources is calculated on the basis of ex situ in vitro and ex situ in vitro - collections of living animals in their natural environment, ex-situ in vitro - collections of living animals in their natural habitat, including: ex-si	Name of the indicator	
The indicator covers the number of plant genetic resources for food and farming (secured in gene bank collections, stored in a generative form — in a seed form and vegetative form — in the form of field plantations, in vitro cultures, microbulbes, etc.) and the number of livestock genetic resources ex situ in vitro and ex situ in vivo. Data total The collections of plants maintained in the gene bank include: agricultural crops (cereals, root crops, special, herbage plants, fodder crops, energy and reclamation crops, small leguminous plants, marginal legumes), vegetable and orchard plants (including root stocks of seed trees, root stocks of stone trees, berry plants), honey and decorative plants. The plant genetic resources are calculated on the basis of the database containing the number of objects and associated data.
