

## Statistics for the SDGs - global indicators

Goal 6. Clear water and sanitation  6.3 By 2030, improve water quality by reducing pollution, eliminating dumping and minimizing release of hazardous chemicals and materials, halving the proportion of untreated wastewater and substantially increasing recycling and safe reuse globally chemically and with an increased removal of nutrients, to the quantity of waste requiring purification discharged waters or into the ground within a year.  Unit percent [%]  Available dimensions  Industrial wastewater includes sewage which is not domestic wastewater or rainwater produced as a result of commercial, industrial, storage, transportation or service activity as well as water mixed with sewage produced by other entities discharged by sewage network owned by this plant. The types and amount of pollutants in industrial wastewater are very diverse. They depend on the type of industry, type of raw materials used in production and the production technology used. In statistics, the industrial wastewater also include cooling water, polluted and saline waters from mine drainage and sewage works as well as social and living wastewaters related to manufacturial wastewater also include cooling water, polluted and saline waters from mine drainage and sewage works as well as social and living wastewaters related to manufacturing "Mining and quarrying", "Manufacturing", "Electricity, gas, steam and air conditioning supply" and "Water supply sewerage, waste management and remediation activities as well as other sections, whose share in the volume of discharged sewage is insignificant. Industrial wastewater requiring treatment means sewage discharged via a network of open canals or ditches directly to waters, ground or sewage network from production entities (including water contaminated as a result of dehydration of mines and contaminated waters used in industry to rocoling). Municipal wastewater treatment plants. Data on municipal wastewater requiring treatment means sewage discharged via a network of yoe commune through sewage was yes		
Goal Goal Colear Water and samination  Target (a.3 By 2030, improve water quality by reducing pollution, eliminating dumping and minimizing release of hazardous chemicals and materials, halving the proportion of untreated wastewater and substantially increasing recycling and safe reuse globally. The ratio of the quantity of industrial and municipal waste water treated biologically, chemically and with an increased removal of nutrients, to the quantity of waste requiring purification discharged waters or into the ground within a year.  Unit percent [%]  Available dimensions  Industrial wastewater includes sewage which is not domestic wastewater or rainwater produced as a result of commercial, industrial, storage, transportation or service activity as well as water mixed with sewage produced by other entities discharged by sewage network owned by this plant. The types and amount of pollutants in industrial wastewater are very diverse. They depend on the type of industry, type of raw materials used in production and the production technology used. In statistics, the industrial wastewater also include cooling water, polluted and saline waters from mine drainage and sewage works as well as social and living wastewaters related to manufacturing processes. Data on industrial wastewater refer to sewage discharged by the entities, which according to Polish Classification of Activity were included under 'Industry' covering 'Mining and quarrying', 'Manufacturing', 'Electricity,' gas, steam and air conditioning supply' and "Water supply sewerage, waste management and remediation activities' as well as other sections, whose share in the volume of discharged sewage is insignificant. Industrial wastewater requiring treatment means sewage discharged via a network of open canals or ditches directly to waters, ground or sewage network from production entities (including water contaminated as a result of dehydration of mines and contaminated waters used in industry for cooling). Municipal wastewater treatment plants. Data on muni	Name of the indicator	6.3.1 Proportion of wastewater safely treated
minimizing release of hazardous chemicals and materials, halving the proportion of untreated wastewater and substantially increasing recycling and safe reuse globally. The ratio of the quantity of industrial and municipal waste water treated biologically, chemically and with an increased removal of nutrients, to the quantity of waste requiring purification discharged waters or into the ground within a year.  Unit percent [%]  Available dimensions  total  Industrial wastewater includes sewage which is not domestic wastewater or rainwater produced as a result of commercial, industrial, storage, transportation or service activity as well as water mixed with sewage produced by other entities discharged by sewage network owned by this plant. The types and amount of pollutants in industrial wastewater are very diverse. They depend on the type of industry, type of raw materials used in production and the production technology used.
